

STATISTICS

INTRODUCTION

The Australian Criminal Intelligence Commission (ACIC) uses the National Illicit Drug Reporting Format (NIDRF) system to process seizure, arrest and purity data for the Illicit Drug Data Report (IDDR). This allows for more accurate analysis of law enforcement data and assists in moving towards nationally standardised data holdings. The ACIC acknowledges the assistance of police statisticians and information managers in this process.

COUNTING METHODOLOGY

The following methodology was used to develop a count of arrests by drug type:

- where a person has been charged with multiple consumer or provider offences for a particular type of drug, that person is counted once only as a consumer or provider of that drug
- where consumer or provider charges for a particular drug type have been laid, the provider charge takes precedence and the person is counted only as a provider of that drug
- a person who has been charged in relation to multiple drug types is counted as a consumer or provider for each drug type
- a person is counted on each separate occasion that they are charged.

DATA SOURCES ARREST AND SEIZURE DATA

The following agencies provided arrest and seizure data:

- Australian Federal Police (AFP)
- Australian Federal Police, ACT Policing
- New South Wales Police Force
- Northern Territory Police
- Queensland Police Service
- South Australia Police
- Tasmania Police
- Victoria Police
- Western Australia Police Force.

DRUG PURITY DATA

The following agencies and organisations provided drug purity data:

- Australian Federal Police
- ChemCentre Western Australia
- Forensic Science SA
- Forensic Science Service Tasmania
- Health System Information and Performance Reporting, New South Wales Ministry of Health.
Sample analysis conducted by NSW Forensic & Analytical Science Service (FASS)
- New South Wales Police Force
- Queensland Health Forensic and Scientific Services
- Victoria Police.

The purity tables only represent purity figures for seizures of that drug type that have been analysed at a forensic laboratory. The number of ‘cases’ in the purity tables reflects the number of individual samples analysed (items), as distinct from the number of seizures/cases (which may have multiple items).

The time between the date of seizure by police and the date of receipt at laboratories can vary from a few days to several months and, in isolated cases, years. The purity table represents those seizures analysed during 2018–19, not necessarily all seizures made during that period.

From 2017, the NSW FASS only tests for purity levels on samples submitted from seizures of a commercial quantity or greater.

South Australia tests for purity levels on cases when the total weight of drug-containing material within a case is >5 grams. All samples with total weight >2 grams are sent for quantitation (if none are >2 grams, then the largest sample is sent for quantitation). When the total weight of drug-containing material within a case is >100 grams, all samples regardless of their total weight are sent for quantitation.

Tasmania Police do not conduct purity determinations on exhibits unless it is specifically requested by the investigator and he/she has a good reason for doing so. Tasmania Police also do not conduct purity determinations on less than 0.5 grams. Legislation in Tasmania does not take into account the purity of the exhibit, so there are very few instances where purity determinations are of great value and hence not worth the significant effort required to determine the purity.

Drug seizures are not routinely tested for purity in the Northern Territory, unless specifically requested. The Misuse of Drugs Act (NT) provides for all of the preparation or mixture to be deemed as if all of the substance (preparation or mixture) is comprised of the dangerous drug found, irrespective of purity.

Due to legislative changes in the Australian Capital Territory, drug seizures are no longer routinely tested for purity.

DRUG PRICE DATA

Data on prices for illicit drugs were collected from each of the police jurisdictions and are based on information supplied by covert police units and police informants. Unless otherwise stated, police price information has been used.

LIMITATIONS OF THE DATA OVERVIEW

Despite limitations in the current dataset, the ACIC's IDR provides the best collection of arrest and seizure statistics available in Australia. The NIDRF data processing system has enabled the ACIC to improve statistical quality and reliability.

DATASETS

Since the development and implementation of the NIDRF processing system, limitations with the administrative datasets used to compile the statistics have decreased. However, the following factors should be considered when using the data to develop assessments or conclusions:

- a lack of uniformity across all states and territories in the recording and storing of data on illicit drug arrests and seizures
- ongoing problems with quality control, resulting in the absence of essential information from some records
- differences in applying a uniform counting and data extraction methodology across all jurisdictions
- differences in definitions of consumer and provider offences across and within jurisdictions over time

- differences in the way drugs and offences may be coded
- insufficient drug identification
- an inability to identify seizures resulting from joint operations, for example, those involving the AFP and a state or territory agency.

DRUG IDENTIFICATION AND CODING

Not all illicit drugs seized by law enforcement are scientifically analysed to establish the precise nature of the drug. In some cases, only seizures of a predetermined weight or those that are the subject of a ‘not guilty’ plea are analysed. In some instances, an initial field test may be carried out to provide an indication as to the seized drug, but all other seizures are recorded at the discretion of the investigating officer and without further qualification.

Historically, a number of jurisdictional data systems did not differentiate between amphetamines and 3,4-methylenedioxymethamphetamine (MDMA). This has restricted the ACIC’s ability to monitor and report on national trends in regards to seizures and arrests of specific ATS drug types. Similar problems continue to exist with the range of drugs recorded as ‘other drugs’. Monitoring and reporting on national trends of these drugs is therefore limited.

RECORDING AND STORAGE METHODS

The lack of consistency between law enforcement agencies in recording illicit drug arrests and seizures presents difficulties when data are aggregated and compared. Disparities exist in the level of detail recorded for each offence, the methods used to quantify the seizures, the way offence and seizure data are extracted, and the way counting rules and extraction programs are applied.

QUALITY CONTROL

Missing, incomplete and non-specific information relating to drug seizures makes it impossible to precisely calculate the total quantity of each drug type seized. Since 2001–02, the NIDRF system has allowed for increased scrutiny of large seizures that may not have been queried in the past.

CONSUMERS AND PROVIDERS

Offenders are classified as consumers or providers in order to differentiate between people who have been apprehended for trading in, as opposed to using, illicit drugs. Those charged with supply-type offences (importation, trafficking, selling, cultivation and manufacture) are classified providers. Those charged with user-type offences (processing or administering drugs for their own use) are classified as consumers.

In some cases, the jurisdictions allocate consumer and provider codes, and in others, the ACIC applies the codes based on the information on the type of offence committed. Further, there are some differences in the methodologies jurisdictions use for applying consumer and provider codes. In some states and territories, the quantity of the drug involved determines whether an offence is regarded as a consumer or a provider offence. Additionally, the threshold quantity that determines whether a person is to be charged as a provider varies over time, both within and between states and territories.

Offender data supplied may exclude law enforcement actions that are the subject of ongoing investigations.

DETECTION DATA

Border detection data supplied may exclude detections that are the subject of ongoing investigations.

SEIZURE DATA

The seizure data presented in Table 35 include only those seizures for which a valid drug weight was recorded. Consequently, it undercounts both the number of seizures and the amount of drug seized for all drug types. Seizure data for ATS, cannabis and other drugs are most likely to be affected by the variety of measurement methods and these figures should be treated with caution when making comparisons between jurisdictions or over time. This table includes seizures by the AFP and state and territory police.

Seizure data supplied may exclude seizures that are the subject of ongoing investigations.

DRUG USE MONITORING IN AUSTRALIA (DUMA) PROGRAM

The DUMA program is an ongoing illicit drug use monitoring program that captures information on approximately 2,200 police detainees per year, across five locations throughout Australia. There are two core components: a self-report survey and voluntary provision of a urine sample which is subjected to urinalysis at an independent laboratory to detect the presence of licit and illicit drugs. The self-report survey captures a range of criminal justice, demographic, drug use, drug market participation and offending information. Urinalysis serves as an important objective method for corroborating self-reported drug use. Not all detainees who respond to the self-report survey agree to provide a urine sample when requested, although the urine compliance rate is high.

NATIONAL WASTEWATER DRUG MONITORING PROGRAM

Wastewater analysis is a technique for measuring population-scale consumption of substances. Following the recommendations of the National Ice Taskforce and National Ice Action Strategy, in 2016 the ACIC received funding under the Proceeds of Crime Act 2002 to deliver the National Wastewater Drug Monitoring Program (NWDMP) over three years. Since then, additional funding in the ACIC's annual budgetary appropriation has allowed for the extension of the program.

The University of Queensland and University of South Australia have been commissioned to provide drug consumption data to the ACIC. A total of approximately fifty wastewater treatment sites nationally are assessed, bimonthly in the case of capital city sites and every four months for regional sites. The aim is to acquire data on the population-scale use of substances causing potential harm, either through addiction, health risks, or criminal and anti-social behaviour. Drugs monitored by the program include nicotine, alcohol, amphetamine, methylamphetamine, cocaine, MDMA, 3,4-methylendioxyamphetamine (MDA), heroin, oxycodone, fentanyl, cannabis, mephedrone and methylone.

The ACIC provides data from the NWDMP in the form of public reports three times per year. The reports present patterns of substance use across Australia, showing differences in levels between capital cities and regional centres within states and territories, and nationally. The collective national data are placed in an international context by comparing findings with European and other studies which conduct similar wastewater analyses. The public reports are accessible on the ACIC website <<https://www.acic.gov.au/publications/reports/national-wastewater-drug-monitoring-program-reports>>.

JURISDICTIONAL ISSUES

Comparing law enforcement data across states and territories is problematic. Figures reported in the IDDR may differ from those reported in other publications. Reasons for this include the date of extraction and the counting rules applied. For the information of agencies and individuals wishing to interpret the data, specific issues regarding jurisdictional data have been identified by the ACIC and the relevant jurisdiction. These issues have been summarised and are presented below.

AUSTRALIAN CAPITAL TERRITORY

ACT Policing provided the ACIC with seizure and offender data. Data are comparable with figures in the IDDR from 2002–03 onwards.

As reported by ACT Policing, Simple Cannabis Offence Notices (SCONs) data may not be a true representation of the number of SCONs issued for the period as offenders may be subsequently summonsed for non-payment and will therefore be included in consumer and provider arrests data.

Data are subject to change and reflect the available data at time of extraction. Totals reported in the IDDR may differ from those published in other reports, including annual reports and other publications.

AUSTRALIAN FEDERAL POLICE

The AFP provided national offender, seizure and purity data. This data was compiled in conjunction with the AFP's Forensic Drug Intelligence team. Seizures resulting from joint operations with the Department of Home Affairs are represented within AFP figures. Totals may differ from those published in other reports, including annual reports and other publications, due to the data extraction being based on more recent data and on the AFP using different drug-grouping categories to the ACIC.

DEPARTMENT OF HOME AFFAIRS

Detections of illicit drugs by the Department of Home Affairs are handed to the AFP for investigation purposes, safe storage and destruction. Border detections are recorded on 'DrugLab', which is updated with confirmed seizure weight data from the AFP. At present, there is no provision for an automatic update of accurate weights to DrugLab. Data relating to the same border detections held by the AFP and DrugLab will differ slightly. This is because only unconfirmed seizure weights are initially recorded. The Department of Home Affairs detection figures are subject to change and reflect available data at time of extraction. As such, figures published in the IDDR may differ from those published in other reports, including Department of Home Affairs Annual Reports.

For operational reasons, the format of data presented in the IDDR may vary from year to year.

From 2010–11, the Department of Home Affairs was unable to provide importation data to populate country of embarkation charts for inclusion in the report. From 2011–12, dehydroepiandrosterone (DHEA) and steroid border detection data are reported as a combined figure.

The Department of Home Affairs advised that statistics relating to cannabis in 2014–15 were impacted by a number of food products containing hemp and cannabis seeds, such as 'Hemp Force Powder' and tea.

From 2012–13, the Department of Home Affairs have provided benzodiazepine and opiate statistics which only represent a component of the larger pharmaceuticals category.

NEW SOUTH WALES

The New South Wales Police Force provided the ACIC with offender, seizure and purity data, with the purity sample analysis conducted by NSW FASS.

From 2017, New South Wales FASS have made changes to their processes in response to legislative changes to the Drugs Misuse and Trafficking Act—amendment 2016. New South Wales Police Force is now able to take a subsample of a seizure and therefore not all seizures are sent to FASS for analysis. Around 50 per cent of samples are sent to FASS and they may or may not be weighted by New South Wales Police Force. The subsamples analysed by FASS are weighted, but purity tests will only be carried out on samples related to a commercial quantity or greater. This will impact the data provided for the IDDR and caution should be exercised in comparing data.

Prior to 2005–06, New South Wales Police Force data was extracted directly from the mainframe recording system (COPS). Since 2005–06, data has been extracted from COPS using a data warehousing application ‘Enterprise Data Warehouse’. Tests to verify the process of data extraction have been undertaken and the New South Wales Police Force is confident that the retrieval process is comparable with previous extracts from COPS.

To improve data quality, in 2015–16 the New South Wales Police Force changed the way in which pharmaceutical drugs are coded. As a result, caution should be exercised in comparing data across the reporting periods.

Data are subject to change and reflect the available data at time of extraction. Totals reported in the IDDR may differ from those published in other reports, including annual reports and other publications.

NORTHERN TERRITORY

Northern Territory Police provided the ACIC with seizure and offender data.

Data collection methods in the Northern Territory have been audited since the 2010–11 report. The change in data collection methodology has resulted in the provision of more detailed and accurate data.

Seizure data for the Northern Territory relate to suspected drug type only. The number of Drug Infringement Notices (DINs) may differ to those extracted from the Integrated Justice Information System.

Kava seizures in the Northern Territory may constitute a significant proportion of the number and weight of other and unknown NEC seizures within a given reporting period.

In the Northern Territory, it is often difficult to obtain accurate date of birth and address details from offenders; however, this lack of detail does not invalidate the data.

Data are subject to change and reflect the available data at time of extraction. Totals reported in the IDDR may differ from those published in other reports, including annual reports and other publications.

QUEENSLAND

The Queensland Police Service provided the ACIC with offender and seizure data. Queensland Health Forensic and Scientific Services provided purity data.

The 2018–19 data reflects further improvements made to the quality of the Queensland Police Service drug seizure and offender dataset. As a result, caution should be exercised in comparing data from previous reporting periods.

Since 2001, a legislated minor drugs offence diversion program requires police to offer an eligible person the opportunity to participate in a drug diversion assessment program with an approved Queensland Health program provider, as an alternative to prosecution. Arrest data provided by the Queensland Police Service includes data for offenders participating in this diversion program.

Data are subject to change and reflect the available data at time of extraction. Totals reported in the IDDR may differ from those published in other reports, including annual reports and other publications.

SOUTH AUSTRALIA

South Australia Police provided the ACIC with offender and seizure data. Forensic Science South Australia provided the purity data.

South Australia Police implemented a new system for recording criminal statistics and other business data in November 2018.

From 2015–16, offender data provided by South Australia Police includes data for offenders participating in its Drug Diversion Program (excluding diversion records not related to a drug seizure). As a result, caution should be exercised in comparing data from previous reporting periods.

The Illicit Drug Diversion Initiative implemented changes which took effect on 1 April 2019. An adult can only be referred to the Drug Diversion Program no more than twice in a four year period and on a third detection, the adult is referred directly to court. This action has resulted in a reduction in drug diversions.

Data are subject to change and reflect the available data at time of extraction. Totals reported in the IDDR may differ from those published in other reports, including annual reports and other publications.

TASMANIA

Tasmania Police provided the ACIC with offender and seizure data. Forensic Science Service Tasmania provided the purity data.

It is important to note that the reported figures may differ from those reported in the Tasmania Police Annual Report and other publications due to the differing counting rules applied.

VICTORIA

Victoria Police provided the ACIC with offender, seizure and drug quantities data from Law Enforcement Assistance Program (LEAP). Drug purity data was provided by Victoria Police Forensics Department. Drug quantities and weights reported are estimates only and are not validated by forensic analysis.

Victorian clandestine laboratory detection figures are taken from the record of attendances by forensic analysts at suspected laboratories and validated by the Clandestine Laboratory Squad.

Data are subject to change and reflect the available data at time of extraction. Totals reported in the IDDR may differ from those published in other reports, including annual reports and other publications.

WESTERN AUSTRALIA

The Western Australia Police Force provided the ACIC with seizure and offender data. ChemCentre provided the purity data.

The 2018–19 data reflects further improvements made to the quality of the Western Australia Police Force drug seizure and offender dataset. A counting rule was developed to overcome a limitation of current recording practices, which would otherwise lead to double-counting of some drug seizures. This has generally resulted in a decrease in the number and weight of seizures compared with previous reporting periods. As a result, caution should be exercised in comparing data from previous reporting periods.

Data are subject to change and reflect the available data at time of extraction. Totals reported in the IDDR may differ from those published in other reports, including the Western Australia Police Force Annual Report and other publications.

Legislation changes for cannabis offences in Western Australia took effect from 1 August 2011 following amendments to the *Misuse of Drugs Act 1981*. The Cannabis Infringement Notice (CIN) was replaced by a Cannabis Intervention Requirement (CIR) which changes the way police should respond when dealing with a person in possession of cannabis. From 1 August 2011, any person who does not have a criminal history and is found to have 10 grams or less of cannabis will be offered 28 days to complete a Cannabis Intervention Session after which no charges will follow. People with previous cannabis-related convictions are ineligible for this option. Participation in a Cannabis Intervention Session is offered once to adult offenders, but twice to juveniles aged between 14 and 17 years, so that subsequent offending would result in charges being brought directly.

EXPLANATORY NOTES

The following explanatory notes relate to terms used in this report.

AMPHETAMINE-TYPE STIMULANTS (ATS)

Unless otherwise specified, ‘amphetamine-type stimulants’ (ATS) include amphetamine, methylamphetamine and phenethylamines.

ARRESTS

‘Arrest’ incorporates recorded law enforcement action against a person for suspected unlawful involvement in illicit drugs. It incorporates enforcement action by way of arrest and charge, summons, diversion program, cannabis expiation notice (South Australia), simple cannabis offence notice (Australian Capital Territory), drug infringement notice (Northern Territory), notice to appear (Queensland) and cannabis intervention requirement (Western Australia). Some charges may have been subsequently dropped or the defendant may have been found not guilty.

CANNABIS

‘Cannabis’ includes cannabis plant, leaf, resin, oil, seed and all other forms.

CATEGORIES FOR CLANDESTINE LABORATORIES

Since 2011–12, jurisdictions have been asked to distinguish detected clandestine laboratories into the following four categories, taken from the United Nations Office on Drugs and Crime Annual Report Questionnaire that is used to inform the World Drug Report.

Addict-based labs (kitchen labs). Only basic equipment and simple procedures are used. Typically, those operating in such laboratories have a limited or non-existent knowledge of chemistry and simply follow instructions. Usually, there are no significant stores of precursors and the amount of drugs or other substances manufactured is for personal use. A typical manufacture cycle for ATS would yield less than 50 grams of the substance.

Other small scale labs. People operating in these laboratories have advanced chemical knowledge. More complex amphetamine-type stimulants may be manufactured. Laboratories may be of similar size to ‘addict-based labs’ but frequently employ non-improvised equipment. They may also include experimental laboratories. The amount manufactured is typically for personal use or for a limited number of close associates. Typical manufacture cycle for ATS would yield less than 500 grams of the substance.

Medium sized labs. Use commercially available standard equipment and glassware (in some cases, custom-made equipment). They are not very mobile, making it possible to recover precursor chemicals and equipment in many cases (production estimates are the most viable and reliable). The amount manufactured at such sites is primarily for illicit economic gain. A typical manufacture cycle for ATS would yield between 0.5 to 50 kilograms.

Industrial scale labs. Laboratories use oversized equipment and glassware that is either custom-made or purchased from industrial processing sources. Such industrial operations produce significant amounts of ATS in very short periods of time, only limited by access to precursors, reagents and consumables in adequate quantities and the logistics and manpower to handle large amounts of drugs or chemicals and process them into the next step. A typical manufacture cycle for ATS would yield 50 kilograms or more.

COCAINE

‘Cocaine’ includes cocaine, coca leaf and coca paste.

DETECTION

In the context of the border environment, the term ‘detection’ refers to the identification of illicit drugs by the Department of Home Affairs.

EMBARKATION POINT

‘Embarkation point’ describes the origin of the transport stage of importations. Embarkation is affected by air and sea transport connection patterns and the location of transport hubs, and may not necessarily reflect the true origin of drugs.

Australia may appear as an embarkation country due to an export-detection. In some instances, it may relate to detections on air passengers travelling domestically on an international flight.

HALLUCINOGENS

‘Hallucinogens’ includes tryptamines such as lysergic acid diethylamide (LSD) and psilocybin-containing mushrooms.

HEROIN AND OTHER OPIOIDS

‘Heroin and other opioids’ include opioid analgesics such as heroin, methadone and pethidine and opiate analgesics including codeine, morphine and opium.

NATIONAL MEDIAN DRUG PRICES

Unless otherwise stated, national median drug prices are calculated using price data reported by four or more jurisdictions.

OTHER DRUGS

'Other drugs' include anabolic agents and selected hormones, tryptamines, anaesthetics, pharmaceuticals and drugs not elsewhere classified. Current reporting processes do not enable detailed identification of these drugs.

PERCENTAGES

Percentages reported in the text of this report have been rounded to whole numbers. As a consequence, they may differ slightly from figures reported in the tables of the report and figures reported in other publications.

PHENETHYLAMINES

Phenethylamines include 3,4-methylenedioxymethamphetamine (MDMA, commonly known as 'ecstasy'), 3,4-methylenedioxymethylamphetamine (MDEA), 3,4-methylenedioxymphetamine (MDA), dimethoxyamphetamine (DMA) and paramethoxyamphetamine (PMA).

SEIZURE

'Seizure' is the confiscation by a law enforcement agency of a quantity of an illicit drug or a regulated drug being used or possessed unlawfully, whether or not an arrest is made in conjunction with that confiscation.

The amount of drug seized may be recorded by weight, volume or as a unit count—for example, number of tablets, plants or bags. The method of estimating the amount of drug seized varies between and within jurisdictions. For example, seizures of ATS in tablet form may be weighed or counted.

STEROIDS

'Steroids' include anabolic and androgenic steroids such as testosterone, nandrolone and stanozolol.

Note: Figures do not represent the purity levels of all amphetamine seizures—only those that have been analysed at a forensic laboratory. The period between the date of seizure by police and the date of receipt at the laboratory and subsequent analysis can vary greatly. No adjustment has been made to account for double counting data from joint operations between the Australian Federal Police and state/territory police.

Note: Figures do not represent the purity levels of all heroin seizures—only those that have been analysed at a forensic laboratory. The period between the date of seizure by police and the date of receipt at the laboratory and subsequent analysis can vary greatly. No adjustment has been made to account for double counting data from joint operations between the Australian Federal Police and state/territory police.
